# Memo: Unit 47 product cooling and storage (DEXPI reference P&ID C01)

2026-10-29 11:13 +03 · DRAFT, not approved

**Decision asked for:** Sales wants +20% throughput (18.0 to 21.6 m3/h). Can the unit do it? Which equipment limits first, and what is the cheapest fix that works?

**Recommendation:** apply the 3 change(s) below; at 120 % throughput every stated limit is within 100 % in the simulation.

• Cooling water to H1007 flow: 20 → 27 m³/h

• Chilled water to H1008 flow: 15 → 18 m³/h

• T4750 tank working volume: 20.8 → 22.1 m³

**Cost class:** no capex.

**Risk:** the open-weights second opinion disagreed on: limiting equipment: H1007, H1008, T4750 vs H1007, T4750; feeds.s47140.m3_h: only the main model changes it; verified in DWSIM: H1007, H1008, T4750 vs H1007, T4750. Relief findings on changed equipment: 6.

**Measure next:** the first 24 h at the new throughput against the model's predicted values.
